Education

Georgia Institute of Technology | Atlanta, GA — December 2024
Bachelor of Science in Computer Science — Faculty Honors, Dean's List, Zell Miller Scholar

Experience

The Home Depot — Atlanta, GA

Software Engineer II — *July 2026 – Present*

- Led security and CI/CD remediation across 15 services, upgrading frameworks and fixing pipelines to eliminate 66 unique critical/high CVEs from production workloads and raise build-gate pass rates from 33% to 100%.
- Led a team of 4 engineers from design through stakeholder validation and handoff of an AI triage agent spanning 7 payment applications; unified code/config tracing, BigQuery, and store telemetry with historical baselines and coverage checks, delivering cited diagnoses and suggested fixes while suppressing false findings.
- Drove JFrog OIDC adoption across 2 teams and 20 repositories, replacing shared Maven/Docker credentials with short-lived, job-scoped tokens; resolved 1,100+ security findings tied to plaintext token exposure in CI logs.
- Productionized daily order reconciliation, replacing laptop scripts, database tunnels, and human GCP credentials with a Kubernetes workflow via cdk8s, Terraform, and Spinnaker; implemented Workload Identity, least-privilege IAM, and Secret Manager/External Secrets, eliminating human production access.
- Re-architected order reconciliation from Cloud SQL to Cloud Spanner mid-migration, engineering an in-container PGAdapter, resolving cross-project IAM blockers, and hardening failure paths via staged production validation; automated 7 weekly runs via Kubernetes CronJob, eliminating ∼120 engineer-hours of recurring toil annually.

Software Engineer I — *January 2025 – July 2026*

- Increased system resilience by implementing Kubernetes Horizontal Pod Autoscaling (HPA) for a core service previously capped at 20 static pods, reducing mean latency from 121 to 72 ms and error rates by 89% while increasing throughput from 24.9M to 34.8M requests/week and enabling dynamic scaling up to 100 pods.
- Reconstructed deployment workflows for legacy Java 1.8 Tomcat services lacking operational ownership by rebuilding CI/CD pipelines and enabling zero-downtime Cassandra credential rotation, eliminating a platform outage risk capable of halting all transaction capture.
- Remediated ∼330 OS-level and Python CVEs across 13 microservices by migrating Docker builds from UBI8 to a minimal internal Artifactory base image, reverse-engineering undocumented build processes and resolving CI/CD 401 authentication failures to enable secure, reproducible container builds.
- Led testing and validation to disable a legacy service component handling ∼27% of transaction volume (14.5 million daily captures/lookups) using BigQuery and Postman, supporting a phased retirement effort involving 12 teams.
- Reduced mean time to recovery ∼50% by implementing an automated Kubernetes rolling-restart job for 20+ microservices, replacing slow Argo Rollouts and accelerating recovery from memory-leak/state-drift issues.

Software Engineer Intern — *May 2023 – July 2023, May 2024 – July 2024*

- Developed an internal product information page for cashiers, streamlining self-checkout processes and reducing customer wait times for associate interventions by ∼25%.
- Leveraged Java, React, and TypeScript to retrieve and surface validated product data across all self-checkout registers, mitigating customer theft by ∼$750,000 annually.
- Optimized the efficiency of configuring 40,000+ registers across 2,300 stores by 90%, in collaboration with 2 interns.
- Truncated maximum deployment time for register updates from 24+ hours to 30 minutes by using Java HttpClient and Flow APIs to streamline retrieval of polymorphic external configurations.

Projects

CDC Data Reconciliation | *Python, FastAPI, SQLite, React, Tailwind CSS*

- Led a team of 6 to automate the reconciliation of case counts for infectious diseases between 50 state health departments and the CDC, alongside doubling as a full-stack software developer.
- Utilized Python to compare state health department and CDC data, highlighting any discrepancies between the two datasets, saving 5000+ hours of manual reconciliation annually.

Skills

Programming Languages: Java, Python, JavaScript, TypeScript, SQL
Technologies/Frameworks: Kubernetes, Google Cloud Platform (GCP), Terraform, cdk8s, Docker, Cloud Spanner, Cassandra, Elasticsearch, BigQuery, Grafana, Prometheus, OpenTelemetry, React, FastAPI, Node.js, JUnit, Git
Concepts: Object-Oriented Programming & Design, Test-Driven Development, NoSQL, Data Structures & Algorithms, Full-Stack, CI/CD, Infrastructure, Distributed Systems, Cloud Computing, Microservices Architecture
